

## BIOMETRIC SECURITY - CONTROLLED ACCESS MEDICAL RECORDS

Embedx is developing a biometric security reader for 7816 configured employee identification badges. ISO standard 7816 is the control specification for government identification and secured portal entry. The same format is employed for storing a biological digital imprint of enrolled personnel who have HIPPA clearance for remote access to secured medical records. The identification card is inserted in the side slot which activates the reader, the touch screen illuminates with location login information and when prompted, the medical professional places digit on reader to verify enrollment status. Verification attributes can enable limited access or expanded access depending on level of security. Embedx has pre sold this device and is actively engaged in final development phase of product. Physical device is similar in size to a Iphone and 66% as thick.
