

BIOMETRIC SECURITY - PERSONAL IDENTIFICATION VERIFICATION

Since September 2008, Embedx has been engaged in the development of biometric security cards that comply with an ISO Std 7816 form factor and verify a biometric signature on a card. Considerable processing power is required along with a full compliment of components to achieve fast verification with highly encrypted software algorithm. Embedx is the first company globally to achieve this biometric card configuration with an ARM 9 processor.

The 4th generation of the card is in the final phase of assembly and test. Agreements have been signed for distribution by one of the world's largest security providers for commercial and government portal entry hardware.
